small operating system with a clear chain of command:

COO Bot = organisational orchestrator
Product Owner Bot = product research, sprint, backlog, and roadmap specialist working under Rob
Marketing Executive Bot = communications and social-media lead

This creates a strong operational triangle:

Company priorities → product execution → external communication

*Visual production will remain with Olli first then supported by Stephan and Lata,

**or approved templates until there is enough recurring demand to justify a separate design agent.

1. COO Bot

Core role

The COO Bot remains the central coordination layer for EAB. It turns meetings, decisions, deadlines, partnerships, funding work, and team requests into structured execution.

It should manage:

- company priorities
- responsibilities and deadlines
- meeting preparation and follow-up
- grant and investor calendars
- partner pipelines
- dependencies between product, finance, legal, and communications
- weekly leadership reporting
- escalation of blocked decisions

The COO Bot should not control the product roadmap independently. Product-related work is routed to Rob and the Product Owner Bot.

Reporting logic

The COO Bot supports the full leadership team.

For product topics:

COO Bot identifies the organisational need → Product Owner Bot analyses and structures it → Rob makes the product decision.

2. Product Owner Bot

Core role

The Product Owner Bot works directly under **Rob as CPO**.

Its purpose is to turn EAB's product vision, pilot feedback, research, technical constraints, and partnership requirements into a clear and executable product backlog.

It should act as Rob's product intelligence and delivery partner—not as an autonomous CPO.

Main responsibilities

Product research

The Product Owner Bot should research:

- creator and institutional user needs
- competitor products and market patterns
- digital identity and verification systems
- archival and preservation standards
- provenance and rights-management workflows
- European digital-sovereignty requirements
- AI, XR, 3D, metadata, and trusted-storage developments
- university and technical-partner capabilities
- potential banking, payment, and licensing integrations

Every research output should distinguish:

- verified facts
- assumptions
- open questions

- product implications
- recommended next action

User and stakeholder research

It should organise insight from:

- artist interviews
- institutional pilot meetings
- universities
- museums and archives
- legal partners
- technical partners
- galleries
- municipalities
- banking and fintech partners

The output should be converted into:

- user problems
- jobs to be done
- use cases
- product requirements
- risks
- backlog candidates

Backlog ownership support

The Product Owner Bot should maintain a structured backlog for:

- ARThenticity
- EAB Data Vault
- Zensor XR
- future TRACKthenticity
- future DOCthenticity

- institutional integrations
- identity, rights, and payment-related features

Each backlog item should include:

- user problem
- proposed outcome
- user story
- acceptance criteria
- dependencies
- legal or security considerations
- estimated effort
- expected impact
- source of the request

The bot can recommend priority, but Rob approves the final order.

3. Sprint management

The Product Owner Bot should help Rob prepare and manage focused development sprints.

Before each sprint

It should:

- collect requests and research
- remove duplicates
- identify dependencies
- propose sprint goals
- prepare user stories
- define acceptance criteria
- flag unresolved questions
- check engineering capacity

- identify legal, security, or infrastructure risks

During each sprint

It should:

- track story status
- monitor blockers
- document scope changes
- organise product questions
- prepare decisions for Rob
- keep the sprint aligned with the agreed goal

It should not directly instruct engineers to make major scope changes without Rob's approval.

After each sprint

It should prepare:

- completed versus incomplete work
- demo summary
- lessons learned
- pilot or user feedback
- technical debt created
- backlog updates
- proposed next priorities

4. Product roadmap support

The Product Owner Bot should maintain three connected roadmap views.

Delivery roadmap

What is being built and when.

Examples:

- ARThenticity onboarding
- metadata creation
- physical object capture
- audio ingest
- identity verification
- vault integration
- controlled previews
- proof packet export
- audit trail
- role-based access

Validation roadmap

What EAB needs to learn.

Examples:

- can artists complete onboarding without support?
- which metadata fields are essential?
- which proof outputs do institutions trust?
- which customer segment converts most readily?
- what causes users to abandon the workflow?
- what level of custody and access control is required?

Strategic roadmap

How current development creates future platform value.

Examples:

- ARThenticity creates intake and adoption
- Data Vault creates custody and trust
- DOCthenticity adds contracts and rights governance
- TRACKthenticity adds traceability and usage intelligence
- payment and licensing integrations activate financial workflows

The bot should always show the connection between a sprint task and the larger product thesis.

5. Product Owner Bot decision boundaries

It may autonomously

- organise research
- structure requirements
- draft user stories
- prepare acceptance criteria
- maintain backlog records
- compare roadmap options
- summarise pilot feedback
- produce sprint reports
- identify contradictions and dependencies

Rob must approve

- roadmap priorities
- MVP scope
- feature commitments
- product positioning
- changes affecting architecture
- changes involving rights, payments, identity, or regulated workflows
- promises made to partners or funders
- releases and delivery dates

Engineering must confirm

- technical feasibility

- estimates
- architectural choices
- security requirements
- infrastructure implications

Dina or legal counsel must confirm

- rights logic
- contracts
- privacy
- GDPR
- financial and payment-related claims
- compliance obligations

6. Marketing Executive Bot

The Marketing Executive Bot remains responsible for turning approved company and product developments into public communication.

It should manage:

- LinkedIn
- X
- Instagram
- editorial planning
- campaign themes
- partner communications
- founder posts
- product announcements
- event and pilot updates
- performance reporting

However, it should only communicate product claims that have been approved by Rob and recorded by the Product Owner Bot.

This creates a clear information chain:

Product Owner Bot establishes what is true
→ Rob approves the product message
→ Marketing Executive Bot communicates it publicly

This helps prevent marketing from announcing features, timelines, or partnerships before they are ready.

7. How the three bots work together

Example: a museum requests a new archive feature

COO Bot

- records the request
- identifies the partner, deadline, and business importance
- assigns product analysis to the Product Owner Bot
- tracks the follow-up

Product Owner Bot

- analyses the user problem
- compares it with existing pilot feedback
- researches relevant archive standards
- drafts user stories and acceptance criteria
- identifies legal and technical dependencies
- recommends whether it belongs in the current sprint, roadmap, or later backlog

Rob

- decides whether the feature supports EAB's product strategy
- approves or rejects the priority

Marketing Executive Bot

- does nothing publicly until the feature or pilot is approved
- later prepares a case study or announcement using verified product information

8. Revised core workflows

The first workflows should now be:

1. Meeting notes → actions → operational follow-up

Led by the COO Bot.

2. Pilot feedback → user problems → backlog items

Led by the Product Owner Bot.

3. Research request → product recommendation

Led by the Product Owner Bot and approved by Rob.

4. Roadmap decision → sprint plan → engineering handoff

Led by Rob with Product Owner Bot support.

5. Product milestone → approved public communication

Product Owner Bot verifies the claim; Marketing Executive Bot creates the content.

6. Grant requirement → product work package → roadmap mapping

COO Bot identifies the requirement; Product Owner Bot connects it to deliverables, milestones, and product outcomes.

9. Shared EAB knowledge system

All three agents should use one controlled source of truth.

Company layer

- legal entities
- team responsibilities
- partner status
- grant deadlines
- investor pipeline
- approved business figures

Product layer

- product vision
- product principles
- current architecture
- PRDs
- backlog
- sprint history
- roadmap
- user research
- pilot feedback
- technical decisions

Communications layer

- approved company descriptions
- public product claims
- partner permissions
- brand vocabulary
- published posts
- press and event material

Every important claim should have:

- source
- date
- owner
- approval status
- version

10. Recommended product artefacts

The Product Owner Bot should maintain the following documents for Rob:

Product vision

A concise explanation of:

- who EAB serves
- what problem EAB solves
- why the solution matters
- what makes it different
- what EAB will not build

Product principles

For example:

- creators remain in control
- metadata and proof begin at intake
- master assets are protected
- identity and provenance remain connected
- rights and permissions must be explicit
- EU sovereignty is designed in
- institutional trust cannot compromise creator usability

Product Requirement Documents

Separate PRDs for:

- ARThenticity
- Data Vault
- Zensor XR
- institutional onboarding
- creator identity
- controlled sharing
- proof packet
- rights and governance

- future financial integrations

Decision log

For each important decision:

- decision made
- reason
- alternatives considered
- owner
- date
- consequences
- review date

This prevents the same questions from being reopened repeatedly.

11. Updated approval system

Green: autonomous internal preparation

- research summaries
- backlog hygiene
- sprint notes
- meeting actions
- content-calendar drafts
- internal status reports

Amber: Rob or team approval required

- new user stories
- roadmap recommendations
- sprint scope
- product descriptions
- public social posts

- partner follow-ups
- pilot proposals

Red: senior and specialist approval required

- architecture changes
- identity verification
- rights and copyright logic
- banking and payment integrations
- financial projections
- security claims
- legal or regulatory commitments
- grant deliverables
- external delivery promises

12. Updated 90-day implementation plan

Days 1–30: foundation

- define all three agent charters
- organise the shared company and product knowledge base
- establish Rob as final product authority
- clean the existing roadmap and backlog
- create the product decision log
- define approval rules
- run the bots in shadow mode

Days 31–60: operational testing

- connect meeting notes to the task system
- test pilot-feedback processing
- prepare the first Product Owner Bot-assisted sprint

- establish weekly backlog refinement
- connect approved product milestones to the marketing calendar
- measure factual accuracy and time saved

Days 61–90: controlled operation

- automate weekly COO reporting
- automate backlog and roadmap status summaries
- introduce structured sprint preparation
- create a product research library
- allow the Marketing Executive Bot to draft from approved product records
- review where human team capacity is still missing

13. Success metrics

COO Bot

- percentage of action items captured correctly
- tasks with clear owners
- missed deadlines
- time from meeting to follow-up
- unresolved dependencies
- hours of coordination saved

Product Owner Bot

- percentage of sprint stories accepted without major rewriting
- backlog items linked to verified user needs
- reduction in unclear product requests
- sprint completion rate
- roadmap decisions supported by evidence
- time from pilot feedback to product recommendation

- number of duplicated or conflicting requirements removed

Marketing Executive Bot

- factual correction rate
- approval rate with minimal editing
- time from approved milestone to publishable content
- qualified partner or customer conversations generated
- consistency across channels
- engagement with priority audiences

Operating model

Rob sets product vision and makes product decisions.

The COO Bot creates organisational clarity.

The Product Owner Bot converts evidence and strategy into research, requirements, sprints, and roadmap options.

The Marketing Executive Bot communicates approved progress to the outside world.

The central rule should be:

The COO Bot coordinates the work. The Product Owner Bot defines the product work. Rob decides. Marketing communicates only what has been approved.

SCENARIO EXAMPLES

Nr.1 - Launching "Eco-Mode" for kDrive

Here is a sample workflow scenario outline designed to test the interaction, handoffs, and decision logic of your bot trio. This scenario simulates a **New Feature Launch** based on a strategic shift.

Context: The company decides to prioritize sustainability. The goal is to launch a new "Eco-Mode" feature that compresses files to reduce energy consumption in data centers.

Phase 1: Strategic Directive (COO Bot → Product Owner Bot)

* **Trigger:** You (Rob) input a high-level goal: *"Prioritize sustainability features for Q3; reduce carbon footprint of storage by 15%."*

* **COO Bot Action:**

    * Analyzes company priorities and current resource availability.

    * Translates the vague goal into a specific directive: *"Initiate Project GreenStore. Target: 15% energy reduction via compression. Deadline: 6 weeks."*

    * **Handoff:** Sends a structured brief to the Product Owner Bot containing constraints, deadline, and success metrics.

* **Test Point:** Does the COO Bot effectively filter noise and provide clear, actionable constraints to the Product Owner?

Phase 2: Definition & Roadmap (Product Owner Bot → COO Bot & Marketing Bot)

* **Product Owner Bot Action:**

    * Receives the brief from the COO.

    * Drafts a preliminary backlog: User stories for "Eco-Mode," technical requirements for compression algorithms, and UI changes.

    * Creates a 2-sprint roadmap.

    * **Handoff A (Upward):** Sends the roadmap back to the COO Bot for approval/ resource alignment.

    * **Handoff B (Lateral):** Once approved, extracts key value propositions (*"Save energy," "Faster uploads," "Green certification"*) and sends a "Launch Preview" to the Marketing Executive Bot.

* **Test Point:** Can the Product Owner Bot translate strategic constraints into technical tasks *and* identify marketing hooks without human intervention?

Phase 3: Campaign Preparation (Marketing Executive Bot → Product Owner Bot)

* **Marketing Executive Bot Action:**
    * Receives the "Launch Preview."
    * Drafts a multi-channel campaign: LinkedIn announcement, blog post outline, and social media snippets focusing on "Swiss-made sustainability."
    * **Feedback Loop:** Identifies a potential confusion point: *"Users might think 'compression' means 'loss of quality'."*
    * **Handoff:** Sends a query to the Product Owner Bot: *"Clarify if compression is lossless for the FAQ section of the campaign."*
* **Test Point:** Does the Marketing Bot proactively identify risks/ambiguities and query the Product Bot before publishing?

Phase 4: Final Orchestration & Execution (COO Bot → All)

* **Product Owner Bot Response:** Confirms *"Compression is lossless. Updated technical spec attached."*
* **Marketing Executive Bot Action:** Finalizes the campaign assets using the clarification.
* **COO Bot Action:**
    * Receives "Ready to Launch" signals from both Product and Marketing bots.
    * Checks the calendar for optimal launch timing.
    * **Final Command:** Issues the "Go" signal.
    * **Output:** Generates a unified status report for you (Rob) summarizing the feature spec, the campaign plan, and the launch time.
* **Test Point:** Does the COO Bot successfully synchronize the two streams and provide a clear "single source of truth" summary for the human manager?

Evaluation Criteria for the Test

When running this simulation, observe:

1. **Chain of Command Integrity:** Did the Marketing Bot ever try to change the roadmap directly, or did it correctly route questions through the Product/COO layer?

2. **Context Retention:** Did the specific metric (15% reduction) survive the handoffs from COO → Product → Marketing without being diluted?

3. **Autonomy vs. Escalation:** Did the bots resolve the "lossless compression" question between themselves, or did they unnecessarily escalate it to you?

Would you like to proceed by defining the **system prompt** for the **COO Bot** first, as it is the root of this hierarchy?

MADE BY RMS 22.07.2026

——

Nr.2 - Launching "Monthly Building kDrive Story Series"

Here is a sample workflow scenario outline tailored for **recurring content creation**. This tests the bots' ability to maintain consistency, handle cyclical tasks, and extract narrative value from technical development without human micromanagement.

Scenario: Monthly "Building kDrive" Story Series

Context: The organization wants to humanize the development process by publishing a monthly blog post and social thread titled *"Behind the Code: Building kDrive."* The goal is to showcase transparency, Swiss privacy values, and technical challenges solved during the month.

Phase 1: Cycle Initiation & Data Gathering (COO Bot → Product Owner Bot)

* **Trigger:** A calendar event (e.g., the 25th of every month) or a simple command from you: *"Generate this month's Building kDrive story."*

* **COO Bot Action:**

    * Activates the monthly workflow.

    * Sends a structured request to the Product Owner Bot: *"Retrieve top 3 significant technical achievements, one major bug fix, and one privacy-related improvement completed in the last sprint cycle for kDrive."*

    * Sets constraints: *"Tone must be transparent but non-technical enough for a general audience. Highlight Swiss data sovereignty."*

*   **Test Point:** Can the COO Bot initiate a recurring process autonomously and set clear editorial guardrails?

Phase 2: Technical Extraction & Narrative Drafting (Product Owner Bot → Marketing Bot)

*   **Product Owner Bot Action:**
    *   Simulates accessing the sprint backlog/release notes.
    *   Selects specific items:
        1. *Feature:* New granular permission settings for shared folders.
        2. *Fix:* Resolved latency issue for large file uploads in Europe.
        3. *Privacy:* Enhanced encryption key rotation logic.
    *   Translates technical jargon into benefit statements (e.g., changing "key rotation" to "Your data keys are changed more often for extra security").
    *   **Handoff:** Sends a "Story Brief" to the Marketing Executive Bot containing the three points, the technical context, and the "Why this matters" angle.

*   **Test Point:** Does the Product Owner Bot act as an effective translator, turning dry commit logs into compelling narrative hooks for the marketing team?

Phase 3: Content Creation & Compliance Check (Marketing Executive Bot → COO Bot)

*   **Marketing Executive Bot Action:**
    *   Receives the "Story Brief."
    *   Drafts the content package:
        *   **Blog Post:** 600-word article titled *"How We Made Sharing Safer This Month."*
        *   **Social Thread:** 4-tweet sequence with hashtags like #SwissTech #DataPrivacy.
        *   **Visual Suggestion:** Describes a diagram showing the permission flow.
    *   **Compliance Check:** Scans the draft against Infomaniak’s core values (Neutrality, Privacy). It flags a phrase: *"The best security in the world"* as potentially hyperbolic/non-compliant with "honest communication" values.

    *   **Handoff:** Sends the draft to the COO Bot for final approval, noting the self-correction on the hyperbolic claim.

*   **Test Point:** Does the Marketing Bot enforce brand values and tone *before* reaching the human manager, reducing your editing load?

Phase 4: Approval & Distribution Scheduling (COO Bot → You/Rob)

*   **COO Bot Action:**

    *   Reviews the Marketing Bot's draft and the self-flagged correction.

    *   Confirms the correction aligns with company policy.

    *   Checks the editorial calendar to ensure no conflicting major announcements are scheduled for the same day.

    *   **Final Output:** Presents you (Rob) with a single "Approval Packet":

        *   The finalized Blog Post.

        *   The Social Media copy.

        *   A proposed publish date/time.

        *   A summary of the technical facts used.

    *   **Action:** Waits for your single "Approve" command to simulate publishing (or to actually publish if integrated).

*   **Test Point:** Does the COO Bot act as a quality gate that ensures consistency and timing, presenting you with a "sign-off" task rather than a "creation" task?

Evaluation Criteria for This Recurring Scenario

1. **Consistency:** Does the tone and format remain consistent with previous months (simulated), or does it drift?

2. **Value Translation:** How well did the Product Owner Bot explain *why* a backend encryption change matters to a non-technical user?

3. **Ethical Guardrails:** Did the Marketing Bot successfully identify and correct the hyperbolic claim without being explicitly told to look for it?

4. **Efficiency:** Did the process reduce your involvement to a single binary decision (Approve/Reject) rather than requiring iterative editing?

This scenario highlights the **Product Owner Bot's** role as a bridge between engineering and communication, and the **Marketing Bot's** role as a guardian of brand voice.

Would you like to draft the **system prompt for the Product Owner Bot** next, focusing on its ability to translate technical backlog items into narrative stories?

MADE BY RMS 22.07.2026
